

Frontiers in Air Quality Science

Celebrating 21 years of the Environmental Research Group

The exposome approach to the study of exposure-disease associations

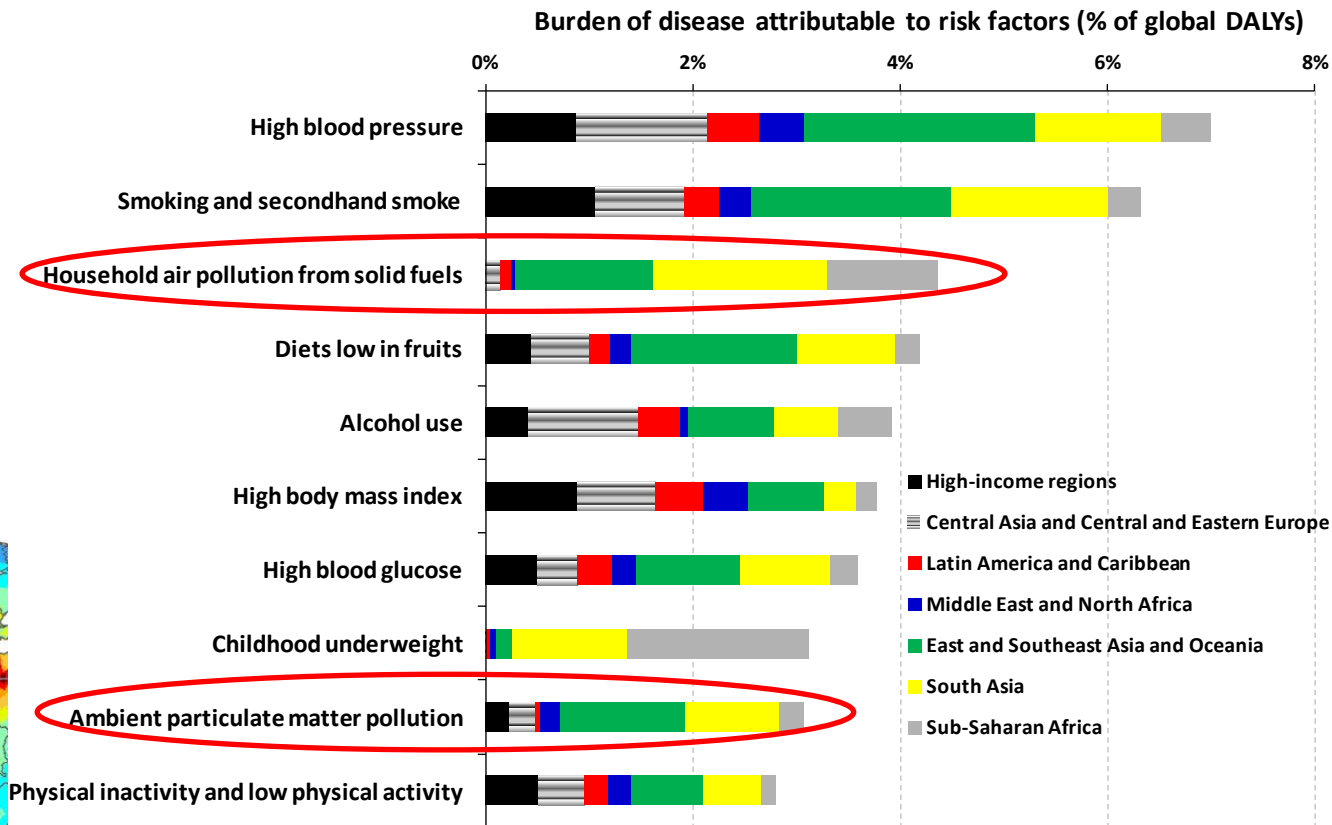

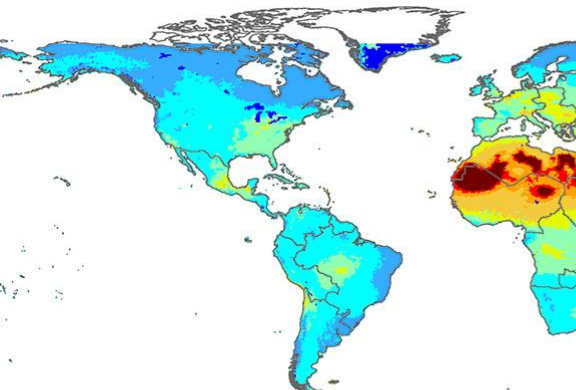

Paul Elliott

“Genetics loads the gun, but Environment pulls the trigger”

After Elliott Proctor Joslin MD,

A pioneering American diabetologist and founder of the
Joslin Diabetes Center, 1869-1962

Br Med J 1991; 302: 1231

Genome-Wide Association Studies (GWAS) Paradigm

- **Untargeted** analysis
- Has led to discovery of hundreds of new replicated genetic associations in past 5 years
- Typically examine 2M+ common variants (measured and imputed) across the genome
 - Problem of multiple testing → Bonferroni correction (genome-wide 5×10^{-8})
- Large sample size (consortia, meta-analyses)
- Replication
- ***Typically explains only a small part of the population variance in disease/trait***

While **genetic data** are a (fixed) digital read-out...

Environmental **exposure data** vary over time, are continuously distributed, with wide dynamic range...

And **difficult to measure**....

Such that ... the quality of the exposure data has been called the **Achilles heel** of environmental epidemiology

New approaches required!

The **Exposome** refers to the totality of environmental “exposures” from conception onwards (Lifecourse)

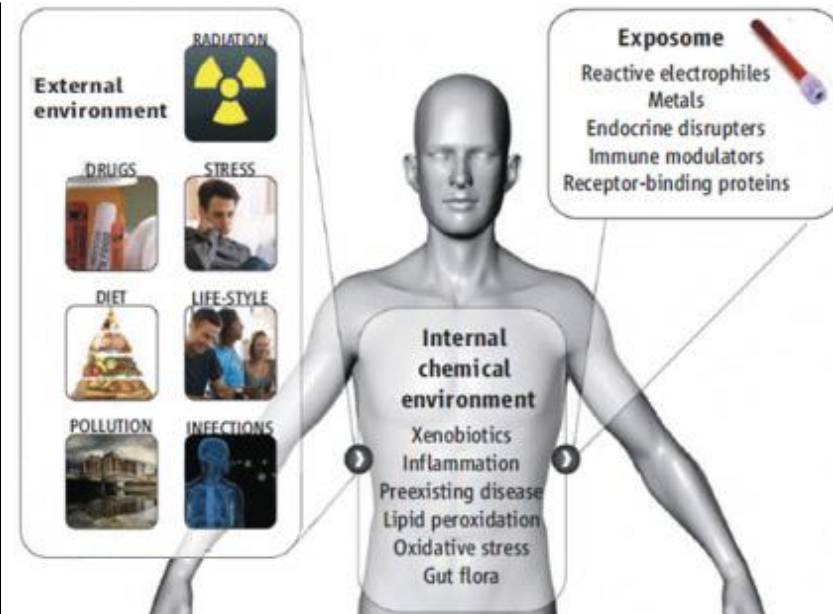

The **internal exposome** is based on measurements in biological material of **complete sets of biomarkers**, especially **during critical life stages**, through use of high throughput **omics techniques** (Rappaport & Smith, *Science* 2010)

Biomarkers cover a wide range of molecules, ranging from e.g., xenobiotics, metabolites in blood or urine (**metabonomics**), proteins (**proteomics**), mRNA (**transcriptomics**), covalent complexes with DNA and proteins (**adductomics**)

Exposome Concept

The Exposome is a new paradigm for studying the environmental causes of disease

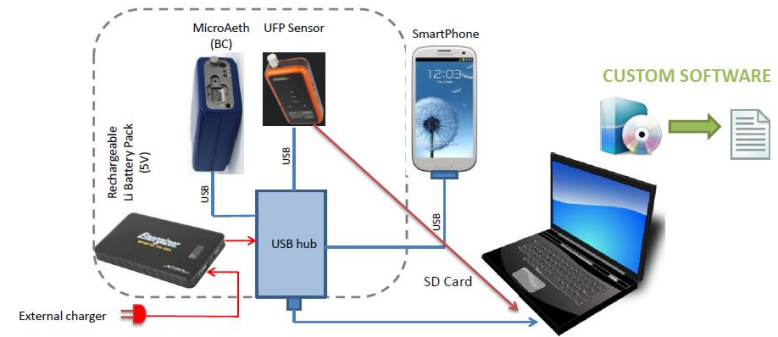

| | |
|---------------------|---|
| Coverage | All chemicals (exogenous and endogenous) and mixtures |
| Focus | Stratified population |
| Study design | Hypothesis generating (discovery) |
| Measurement | Better and quantitative measurements, understanding of mechanisms |
| Monitoring | External and internal environment |
| Time frame | Conception through late adulthood, life-course |

Rappaport and Smith, *Science*, 2010

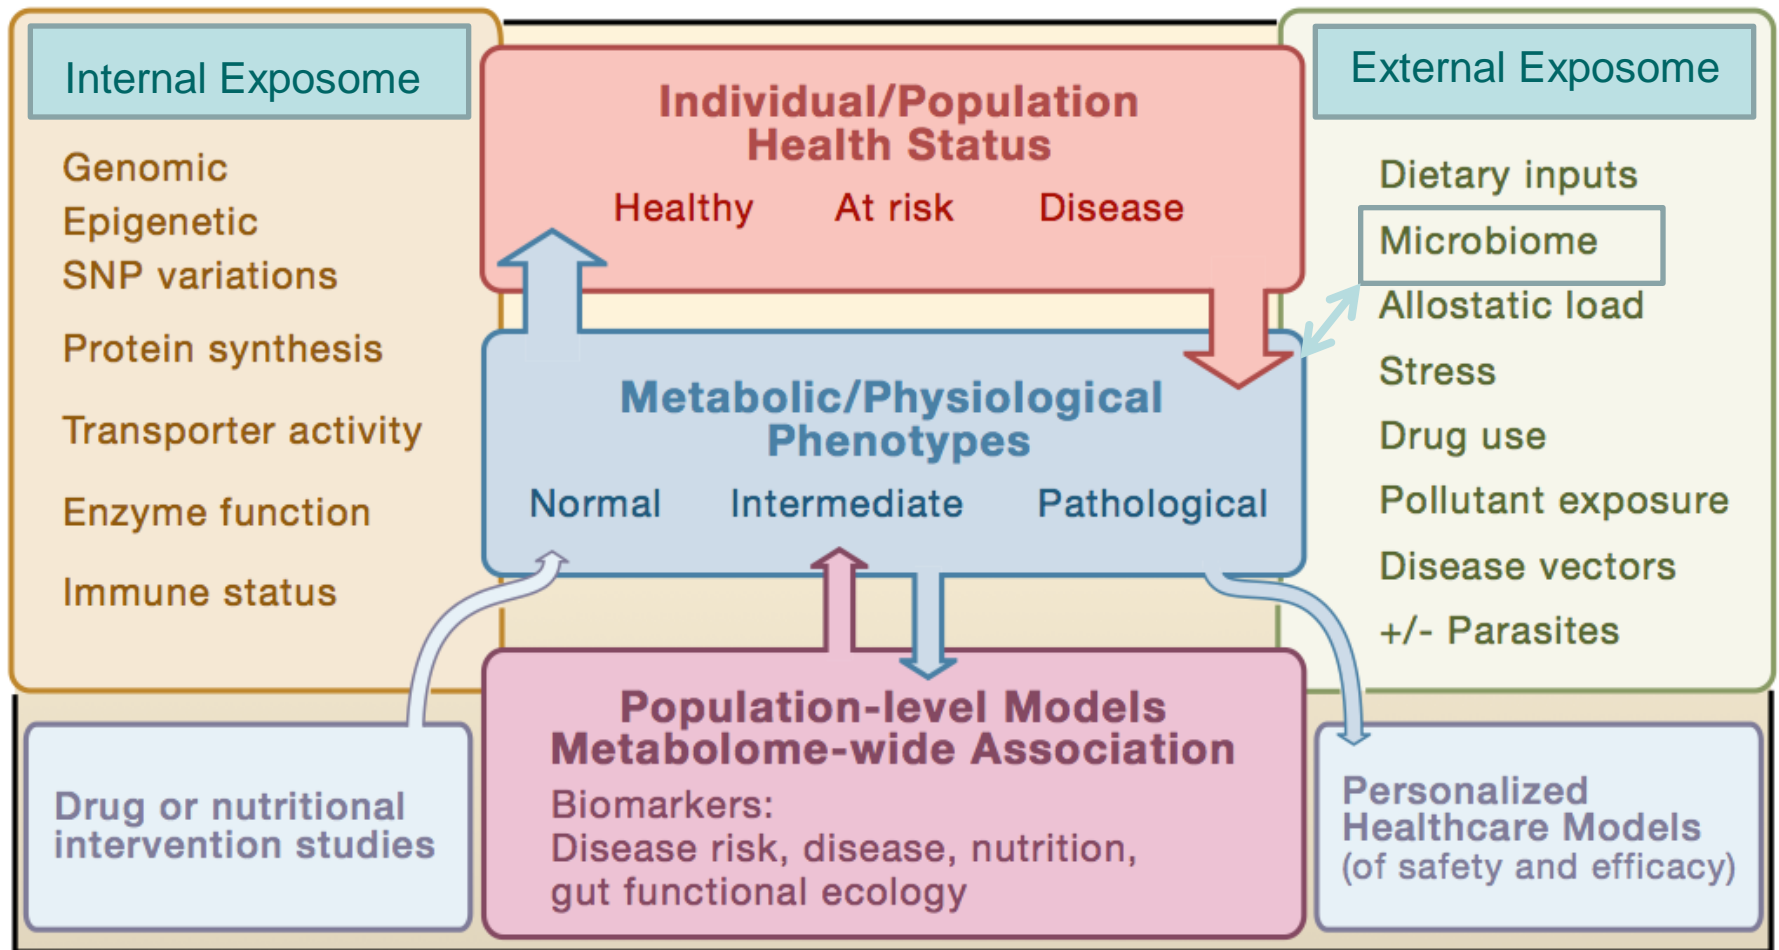

Exposome - New Opportunities

- New technologies for measurement and modelling of environmental exposures
- New approaches (*omics*) to capitalise on population cohorts and biobanks
- New insights on pathways and mechanisms linking environmental exposures to disease (*exposome*)

Metabolic Profiling

Study of the complement of small molecules within biological systems
Also known as metabolomics or metabonomics

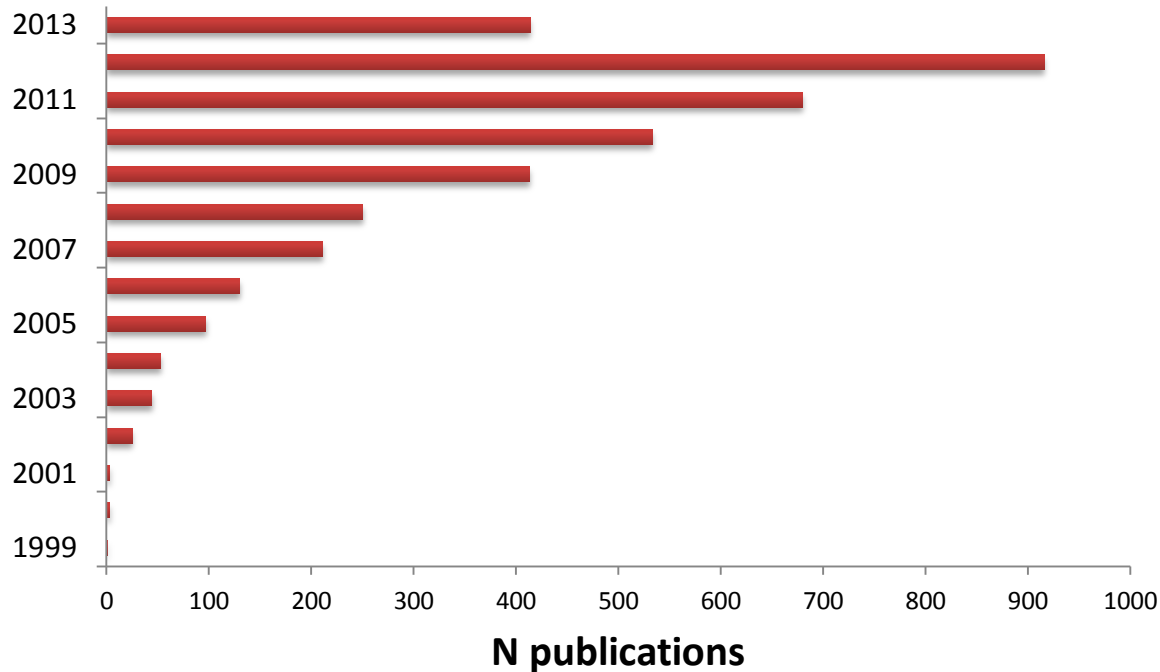

Untargeted: No prior hypothesis of specific metabolites involved

System ↔ Environment

MRC-PHE
Centre for Environment & Health

Metabolomics publications

- Publications in PUBMED with terms (metabolomic* OR metabonomic* OR metabolome) by year of publication

Tzoulaki et al *AJE* 2014 (in press)

NMR metabolomics

High-throughput Analytical Analysis of metabolite content of biological samples

7,200 spectral points

Human urine NMR spectrum

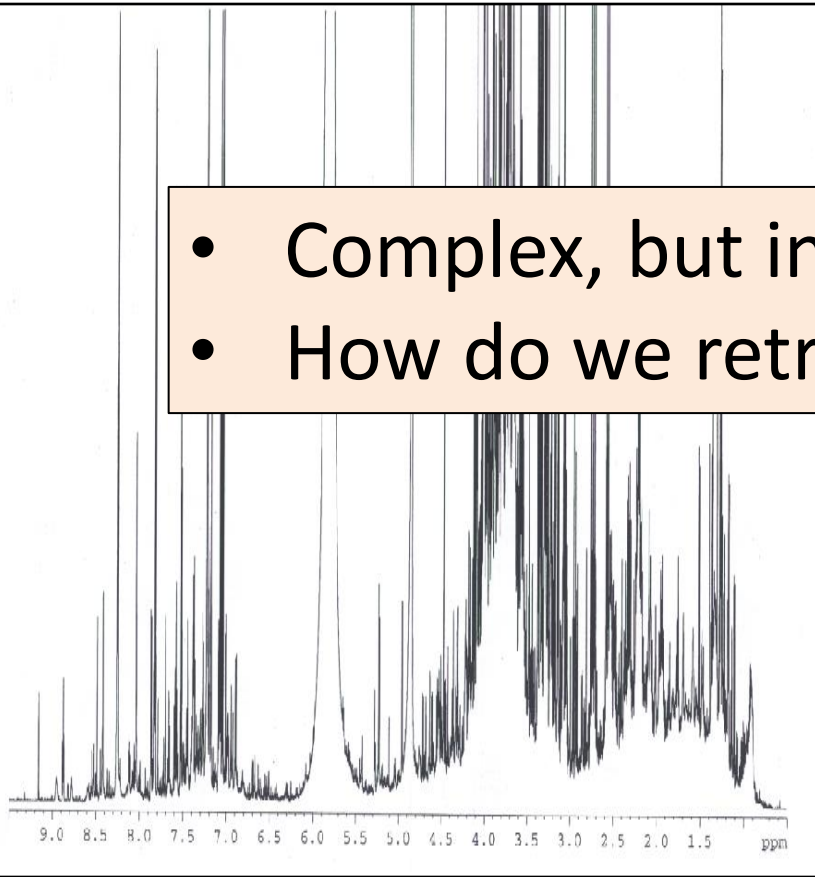

¹H Nuclear Magnetic Resonance (NMR) Spectroscopy (600 MHz, Bruker)

The Challenge of Metabolomic Data

NMR

LC-MS

- Complex, but information rich
- How do we retrieve the information?

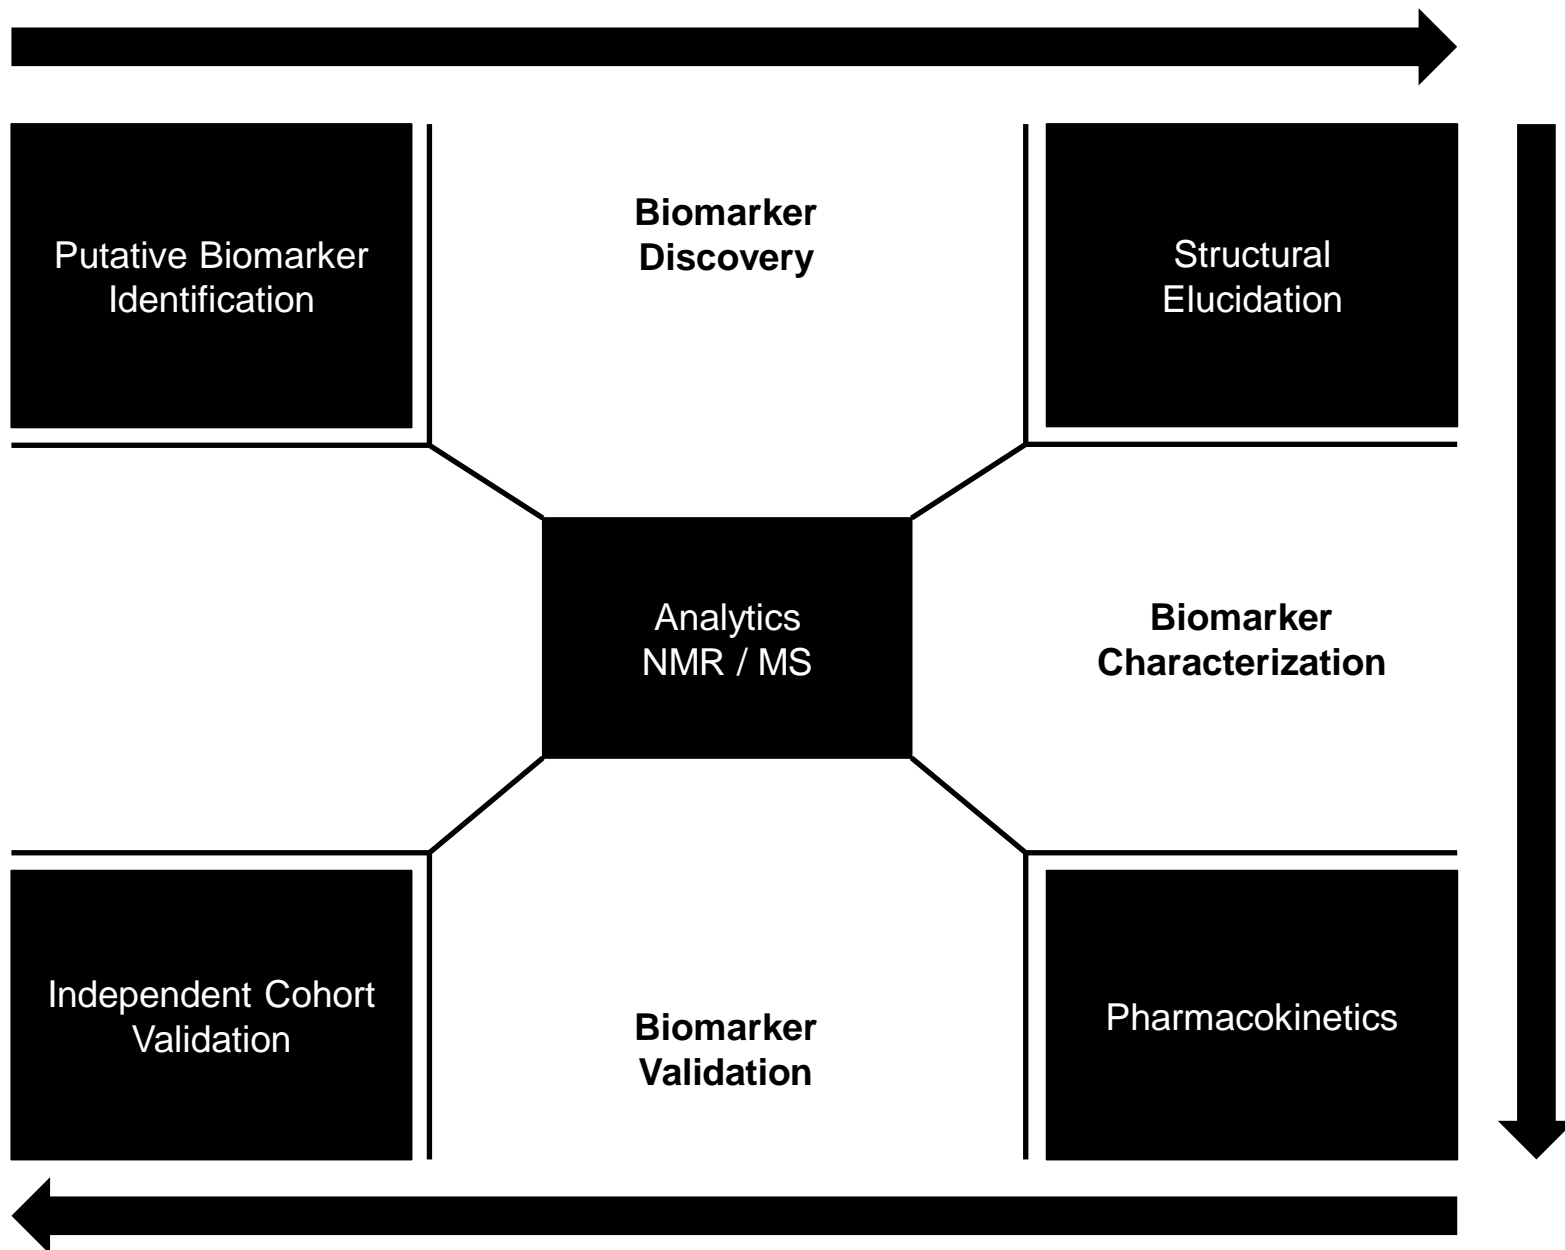

~1000s signals, 100s metabolites

~10,000s signals, 1000s (?) metabolites

Measuring The Metabolome

Human metabolic phenotype diversity and its association with diet and blood pressure

Nature 2008

Metabolites responsible for discriminating populations and diet, also showed significant associations to blood pressure in individuals

Table 1 | Estimated mean differences in systolic and diastolic BP

| Urinary metabolite | A* | |
|--------------------|-----------------------|---------|
| | Not adjusted for BMI‡ | |
| Alanine | 2.69 | (6.06) |
| Formate | -1.19 | (-2.62) |
| Hippurate | -2.10 | (-4.85) |
| N-methylnicotinate | -0.09 | (-0.21) |
| Alanine | 1.57 | (5.17) |
| Formate | -0.90 | (-2.96) |
| Hippurate | -0.98 | (-3.33) |
| N-methylnicotinate | -0.07 | (-0.25) |

Figure 1 | Hierarchical cluster analysis using group average linkage based on median ¹H NMR urine spectra, by population sample and gender (n = 4,630). Data for first 24-h urinary specimens.

Discriminatory metabolites - across populations

| Urinary Metabolites | NMR Spectroscopic Data | |
|--|-----------------------------------|--|
| | Moieties | Signal directly observed, δ [‡] |
| 2-aminoisobutyric acid | CH; CH ₂ | 1.20 (d); 2.61(m) ; 3.11(m) |
| 2-hydroxyibuprofen | CH ₃ | 1.12(s) ; 1.52(d); 2.78(s); 3.56(t); 3.83(q); 3.98(q); 7.22-7.37(m) |
| 2-oxoglutarate | CH ₂ | 2.45(t) , 3.00(t) |
| 3-hydroxyisovalerate | CH ₃ | 1.27(s) ; 2.37(s) |
| Acetylcarnitine | CH ₃ | 2.17 (s); 2.52(dd); 2.65 (dd); 3.21(s) ; 3.61 (d); 3.85(dd) |
| Alanine | CH ₃ | 1.48 (d) ; 3.79 (qt) |
| Citrate | CH ₂ | 2.54(d) ; 2.66(d) ; |
| Creatine | CH ₂ | 3.04(s); 3.94(s) |
| Ethanol | CH ₂ ; CH ₃ | 1.2(t) ; 3.65(q) |
| Ethylglucoside | CH ₃ | 1.24(t) ;3.41(dd);3.55(dd);3.69(m);3.71(dd);3.77(dd);3.80(q);3.86(dd) |
| Formate | CH | 8.46(s) |
| Guanidinoacetate | CH ₂ | 3.80(s) |
| Hippurate | CH ₂ ; CH; CH; CH | 3.97 (d) ; 7.55 (t) ; 7.64 (t) ; 7.84(d) |
| Lysine | CH ₂ ;CH ₂ | 1.47(m); 1.72 (m); 1.89 (m) ; 3.01 (t) ; 3.77(t) |
| N-acetyl-glycoproteins | CH ₃ | 1.98 - 2.06 |
| N-methyl-2-pyridone-5 carboxamide | CH; CH | 8.34(m) |
| N-methylnicotinate | CH ₃ ;CH; CH;CH | 4.44(s) ; 8.08(t) ; 8.84(t) ; 9.13(s) |
| NNN-trimethyllysine | N-(CH ₃) | 3.12(s) ; 3.35(m); 3.76(m) |
| Phenylacetylglutamine | CH; CH | 1.98 (m) ; 2.13 (m); 4.20(m); 7.37(t) ; 7.43(t) |
| Protein envelope (unresolved) [‡] | - | 0.90 - 0.98 |
| Sarcosine | CH ₃ | 2.75 (s) |
| Suberate | CH ₂ | 1.31(m) ; 1.55(m) ; 2.18(t) |
| Succinate | CH ₃ | 2.41(s) |
| Taurine | CH ₂ | 3.26 (t); 3.43(t) |
| Trimethylamine-N-oxide | N-(CH ₃) ₃ | 3.27 (s) |
| Unknown 1 | - | 2.80 (s) |
| Unknown 2 | - | 3.36(s) |
| Unknown 3 | - | 1.27 |
| Unknown 4 | - | 7.96 (m) |
| Unknown 5 | CH ₃ | 2.78 (s) |

Criteria for discriminatory metabolites included $P < 7 \times 10^{-6}$ (Bonferroni) and ranked in top 5% of all coefficients for both 1st and 2nd 24-h urine specimens

‡ chemical shifts in bold indicated signals found to be significantly different in the OPLS-DA pairwise comparisons (Suppl Fig. 1A) and those not in bold were directly observed in 1D ¹H-NMR and their connectivities confirmed by statistical total correlation spectroscopy (STOCSY)

‡ protein envelope is overlapped with superimposed signals from isoleucine, leucine, valine

Holmes et al, *Nature*, 2008

Dietary and Urinary Metabonomic Factors Possibly Accounting for Higher Blood Pressure of Black Compared With White Americans

Results of International Collaborative Study on Macro-/Micronutrients and Blood Pressure *Hypertension* 2013 ;62:1074-80

Jeremiah Stamler, Ian J. Brown, Ivan K.S. Yap, Queenie Chan, Anisha Wijeyesekera, Isabel Garcia-Perez, Marc Chadeau-Hyam, Timothy M.D. Ebbels, Maria De Iorio, Joram Posma, Martha L. Daviglus, Mercedes Carnethon, Elaine Holmes, Jeremy K. Nicholson, Paul Elliott, for the INTERMAP Research Group

Figure. Median urinary proton nuclear magnetic resonance spectrum of INTERMAP US black and non-Hispanic white American (NHW) participants (**top**), based on the first urine collection ($n=1455$). Manhattan plot indicating the significant spectral variables (**bottom**). Metabolites higher in black individuals compared with NHWA are shown in red; metabolites higher in NHWA individuals compared with blacks are shown in blue. 1 indicates leucine; 2, 3-hydroxyisovalerate; 3, 2-hydroxyisobutyrate; 4, *N*-acetyls of glycoprotein fragments; 5, *N*-acetyl neuraminic acid; 6, succinate; 7, dimethylamine; 8, trimethylamine; 9, dimethylglycine; 10, lysine; 11, creatinine; 12, hippurate; and 13, *N*-methyl nicotinic acid.

3-HV, 3-hydroxyisovalerate; DMG, dimethylglycine; 4-DEA, 4-deoxyerythronic acid.

EXPOsOMICS: Mission

- Exposomics aims to predict **individual disease risk** related to the environment, by characterizing the **external and internal exposome** during critical periods of life, including in utero, based on established European cohorts
 - Focus on air and water pollution
 - Focus on the external exposome in adults

Experimental Short Term Studies (STS)

New measurements

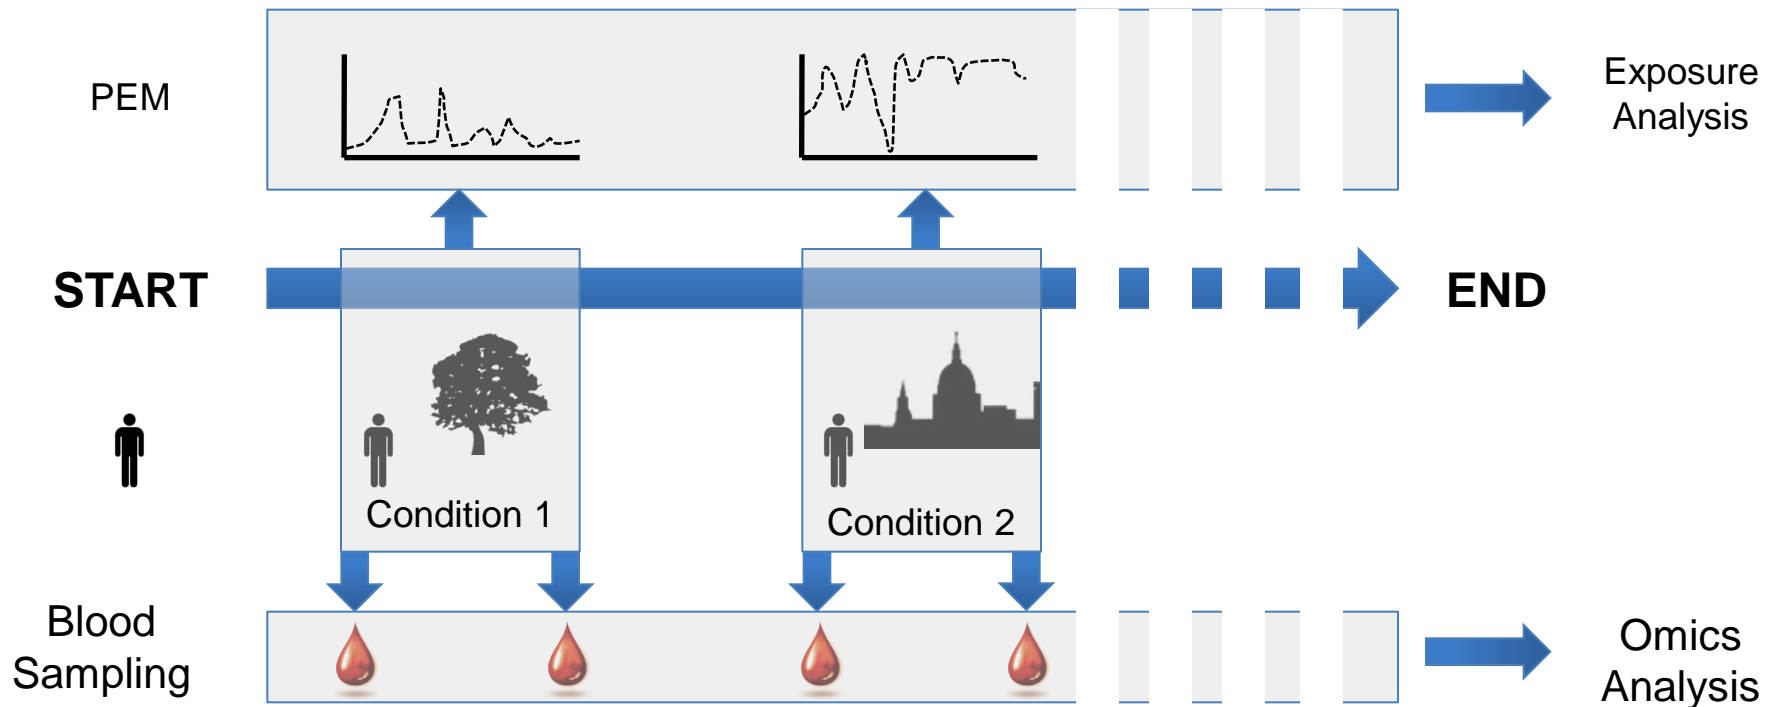

- Oxford Street 2
- TAPAS

Existing resources

- Oxford Street 1
- RAPTES

Outline

- Contrasting levels of AP (high/low) during exposure periods
- PEM measurements made during exposure periods
- Blood samples for omics before and after each exposure period

Mother-Child Cohort Studies and Adult Long-Term Studies

New measurements

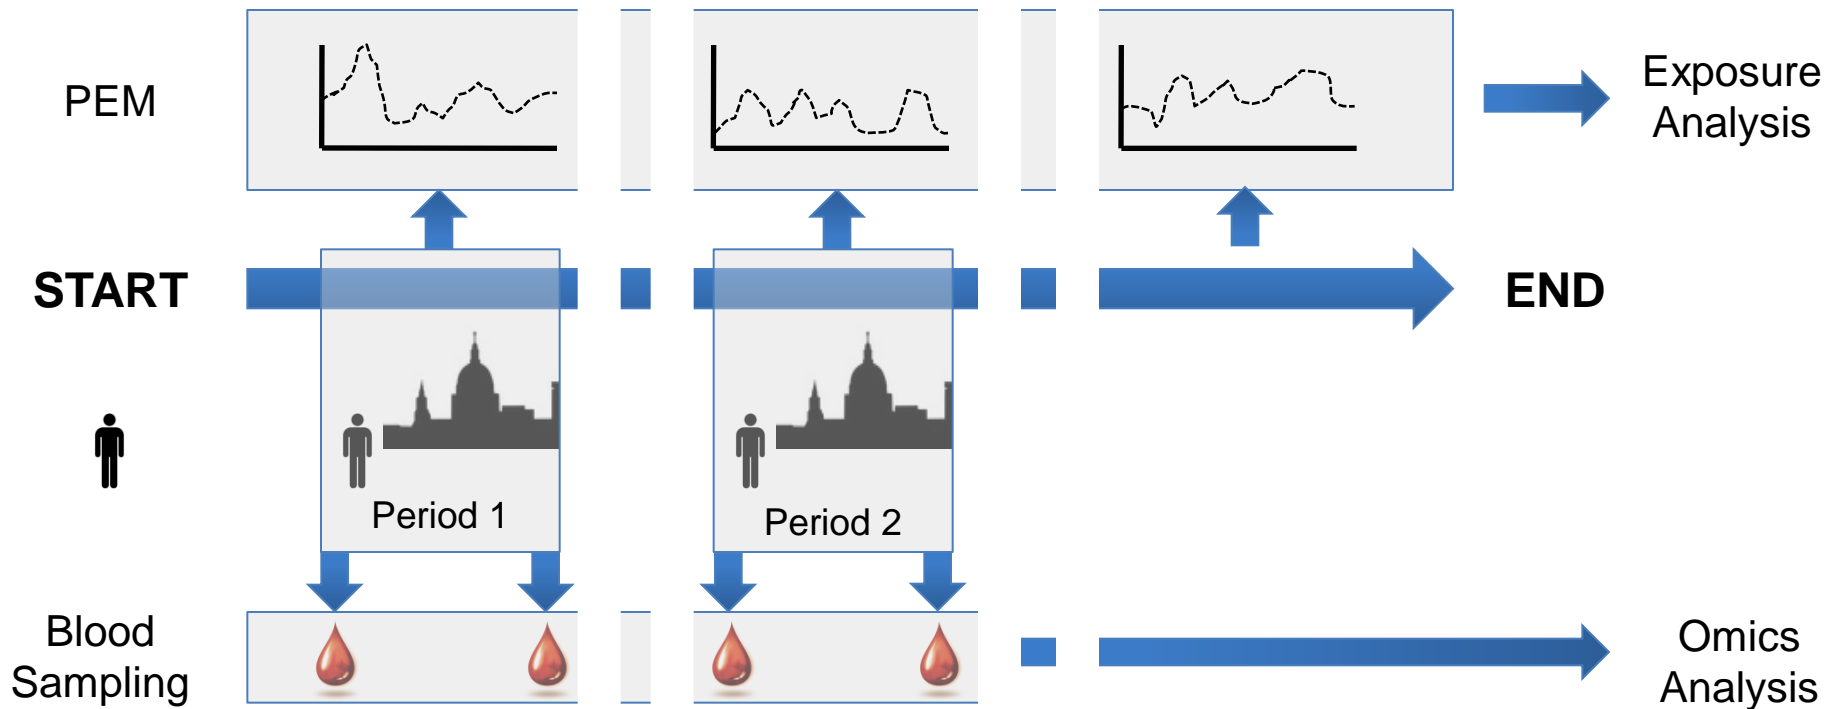

- INMA
- EPIC-ESCAPE and East Anglia
- SAPALDIA

Existing resources

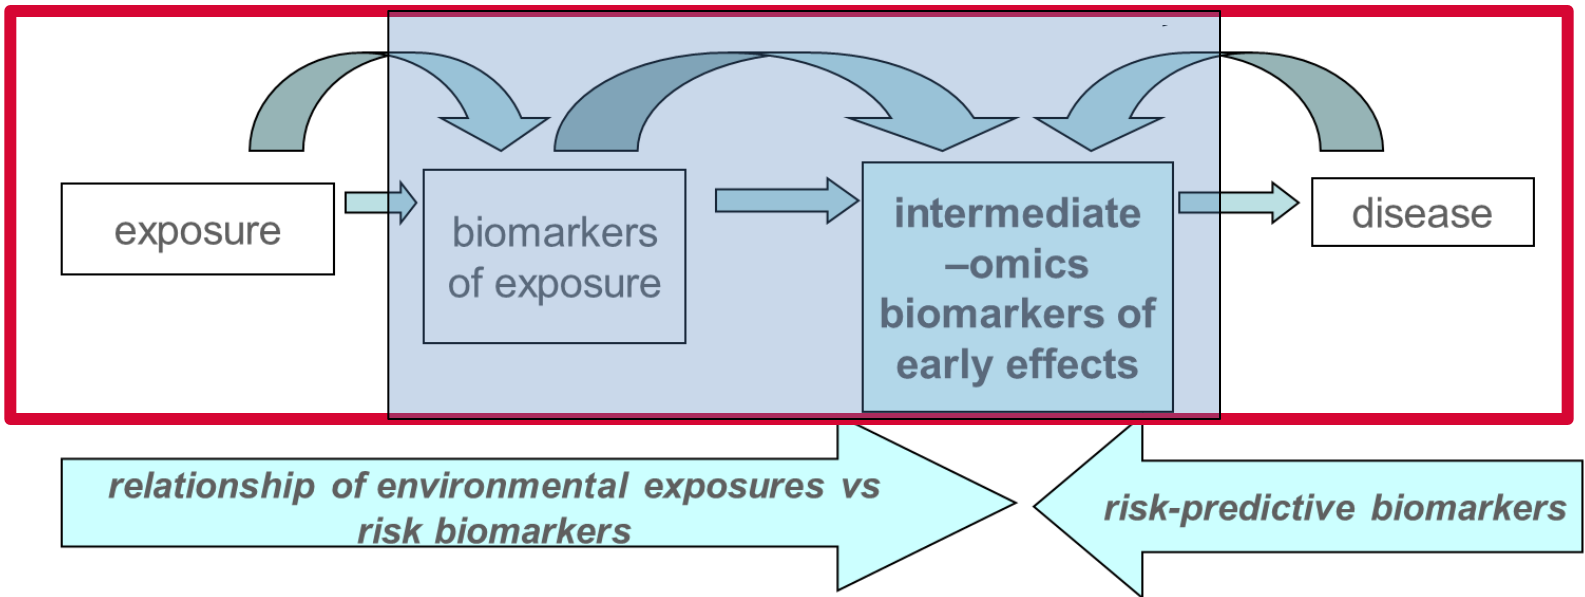

- INMA
- EPIC-ESCAPE and East Anglia
- Rhea
- ALSPAC
- Piccoli+

Outline

- Participants in existing cohort studies with stored blood samples
- PEM measurements will be made during three periods at five sites

Meet-in-the-middle Research Paradigm

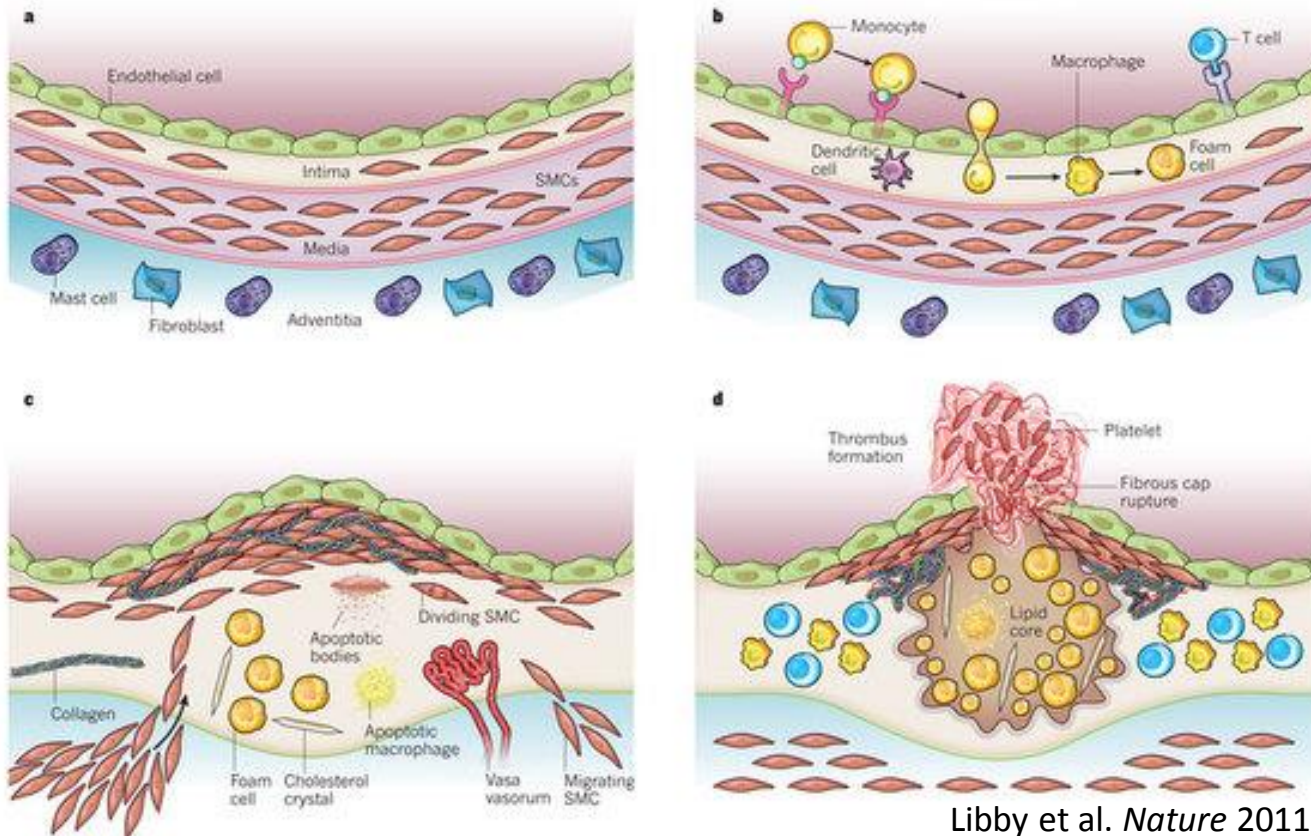

Chadeau-Hyam et al *Biomarkers* 2011; 16(1): 83–88

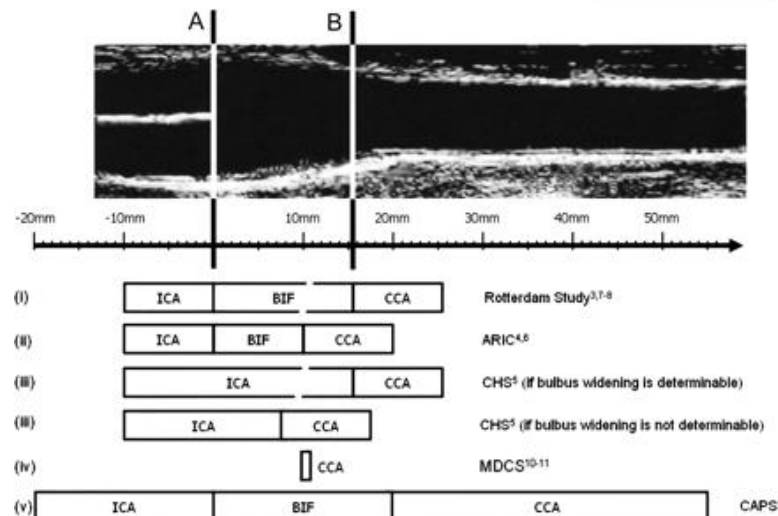

COMBI-BIO: Specific Aims

- To use systems biology approaches, based on **metabolic phenotyping** and computational medicine, to discover, test and validate novel biomarkers for subclinical atherosclerosis;
- To use cross-platform (NMR, MS) and multi-omics (genome-wide, metabolome-wide) analyses to investigate underlying biochemical pathways, and hence to advance understanding of aetiopathogenesis of atherosclerosis development and progression;
- To develop prognostic combinatorial biomarkers and risk scores to improve early prediction and patient stratification/management for subclinical atherosclerosis.

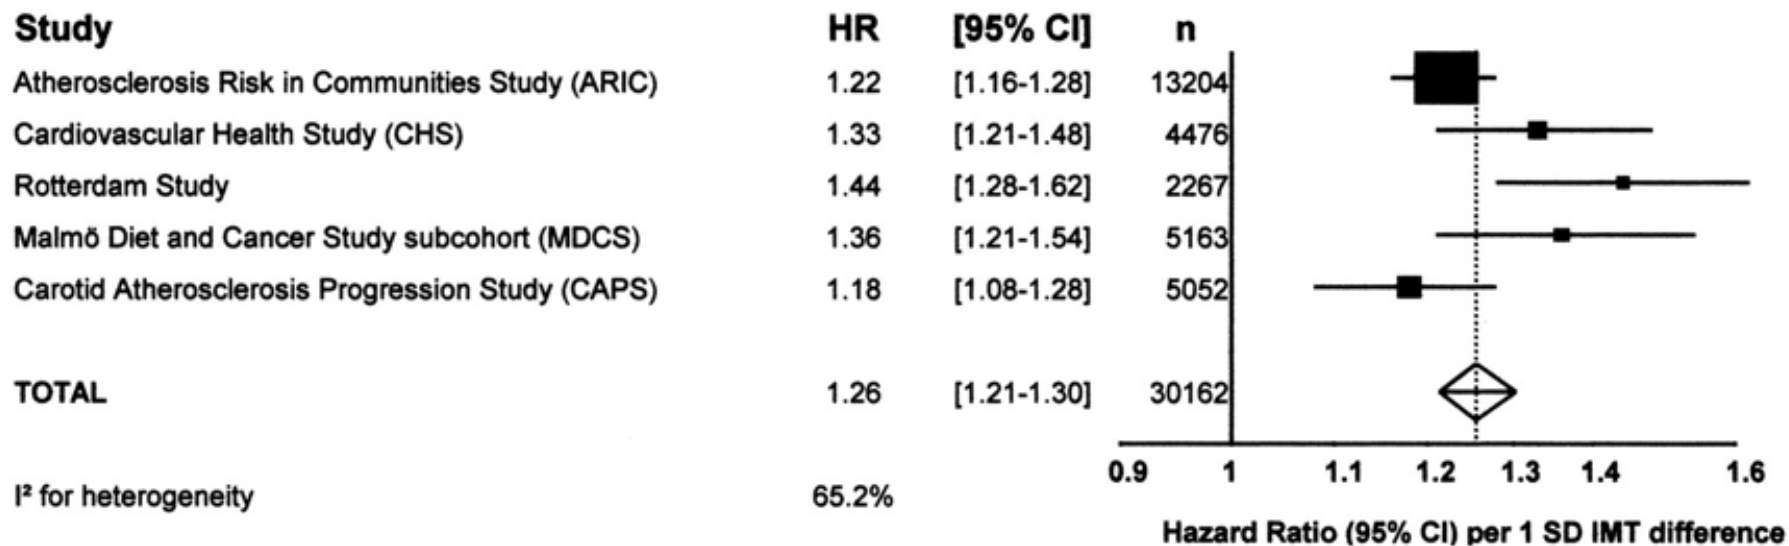

- Systemic chronic disease of the arterial wall
- Remains subclinical for many decades
- Main underlying cause of MI
- Pathophysiology of atherosclerotic lesion formation and of complications still poorly understood

- Intima-media thickness of carotid arteries
- Established measurement of early disease

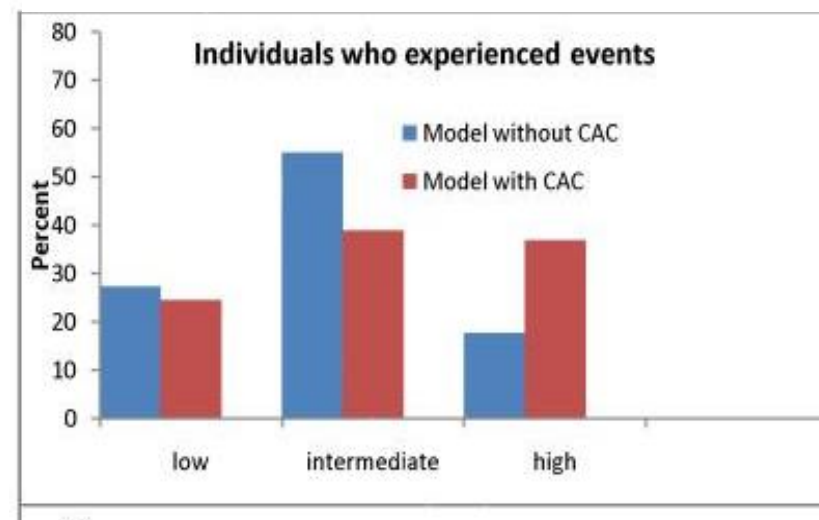

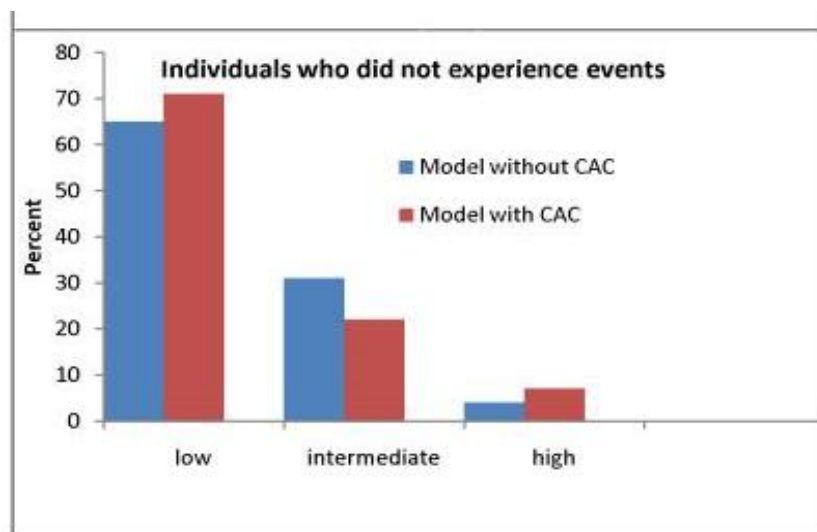

A Hazard ratio (HR) for MI per 1 SD difference in CCA-IMT, adjusted for age and sex

Lorenz et al. *Circulation* 2007, 115 (4) 459-467

- Coronary artery calcium
- In MESA, addition of CAC to traditional risk factors improved classification of individuals according to risk

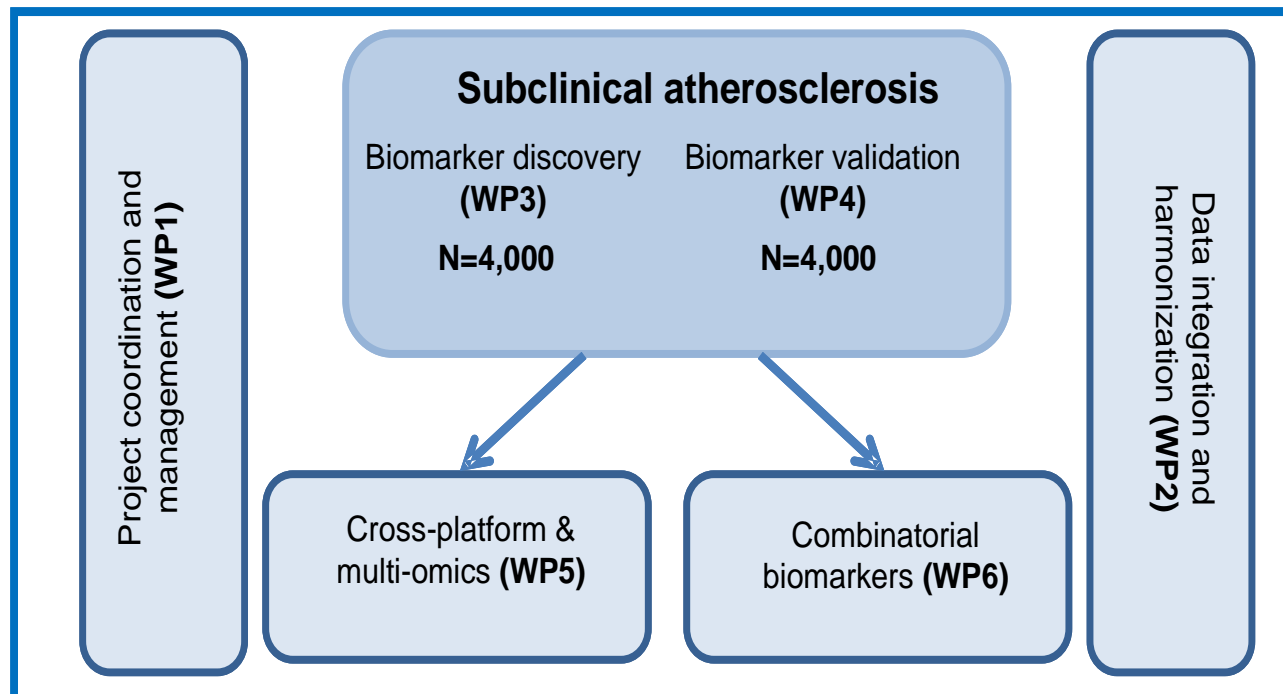

Polonsky *et al.* *JAMA* 2010; 303(16): 1610–1616.

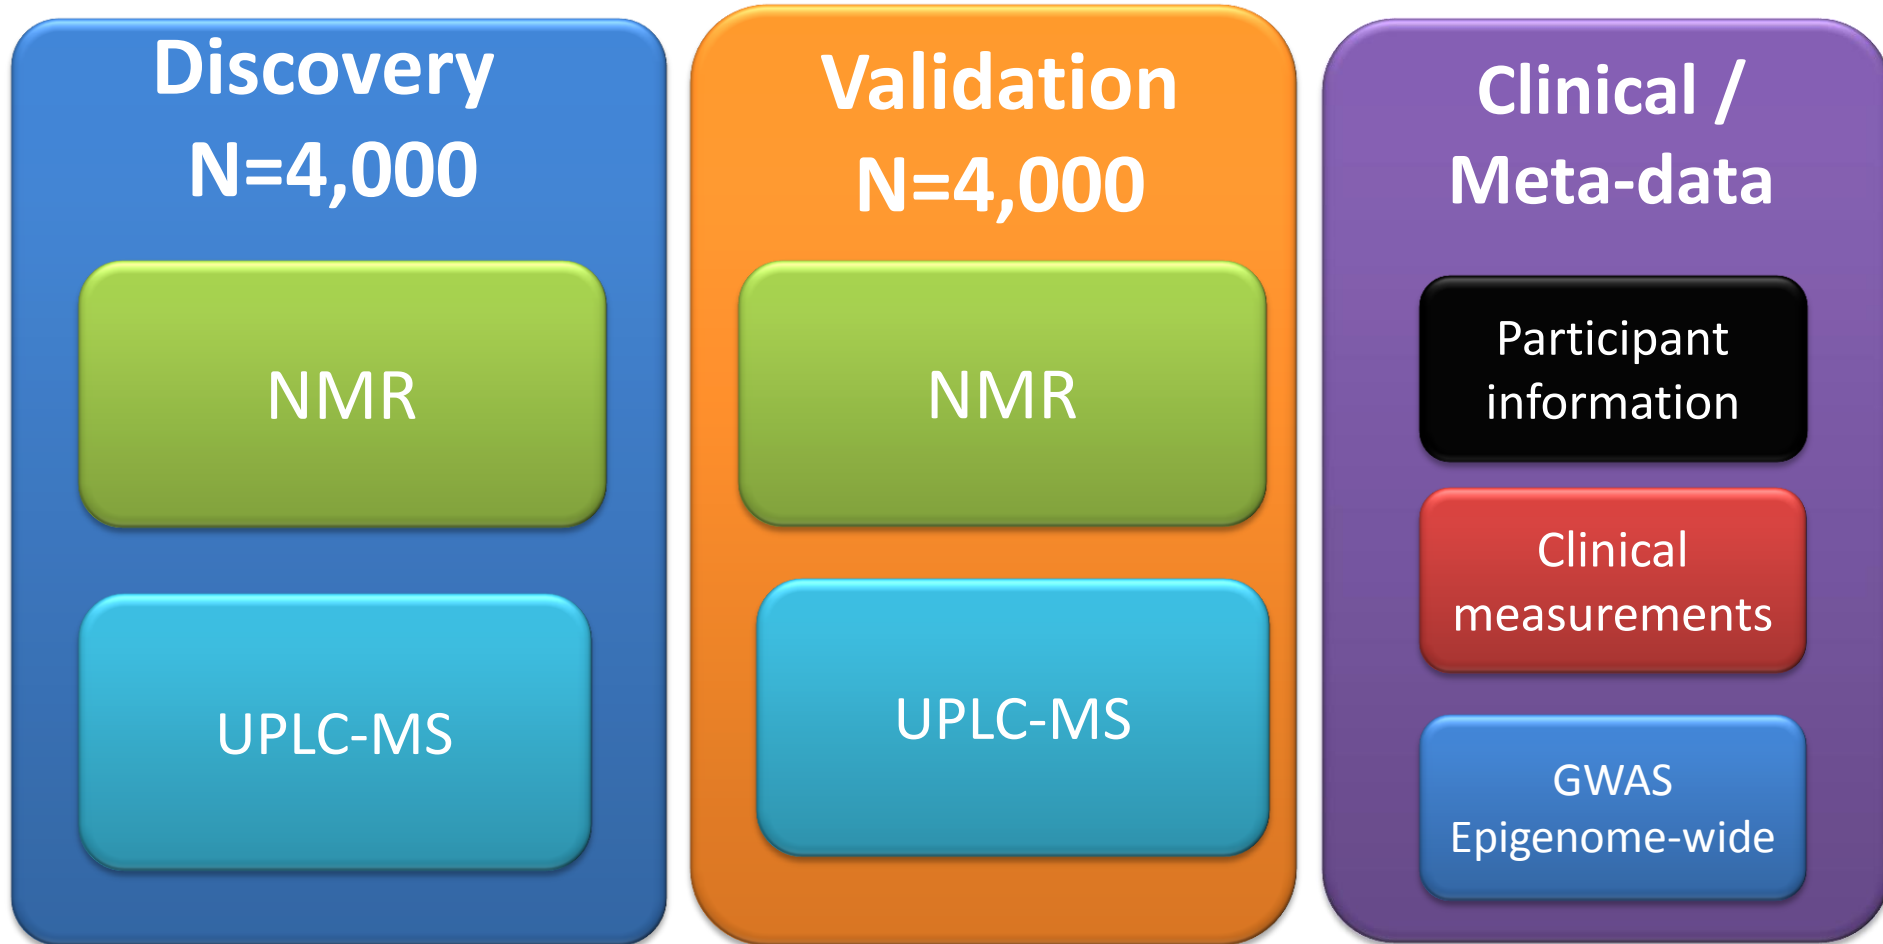

COMBI-BIO Cohorts and Study design

Table 1.1b Cohorts and numbers of participants for discovery and validation of novel metabolic biomarkers for subclinical atherosclerosis* in COMBI-BIO

| | Discovery | Validation |
|--|--------------|--------------|
| West London LOLIPOP cohort | 1,000 | 1,000 |
| Rotterdam Study | 1,000 | 1,000 |
| Multi-Ethnic Study of Atherosclerosis (MESA) | 2,000 | 2,000 |
| TOTAL | 4,000 | 4,000 |

*Subclinical atherosclerosis measurements of both coronary artery calcium (CAC) and carotid intima medial thickness (IMT) available for each participant

Metabolic characterization of phenotypes (CAC, IMT) measured within cohorts

Wellcome Trust Sustaining Health Pilot (China) Study concept

Intervention

Risk factor
exposure

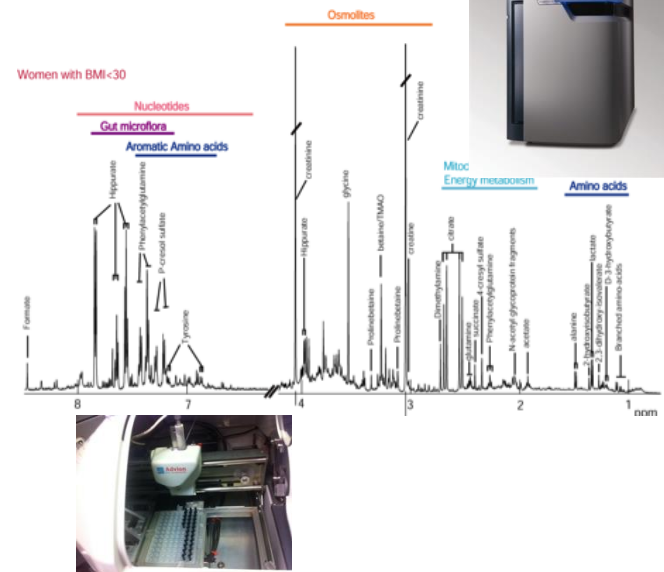

Biomarkers of
exposure

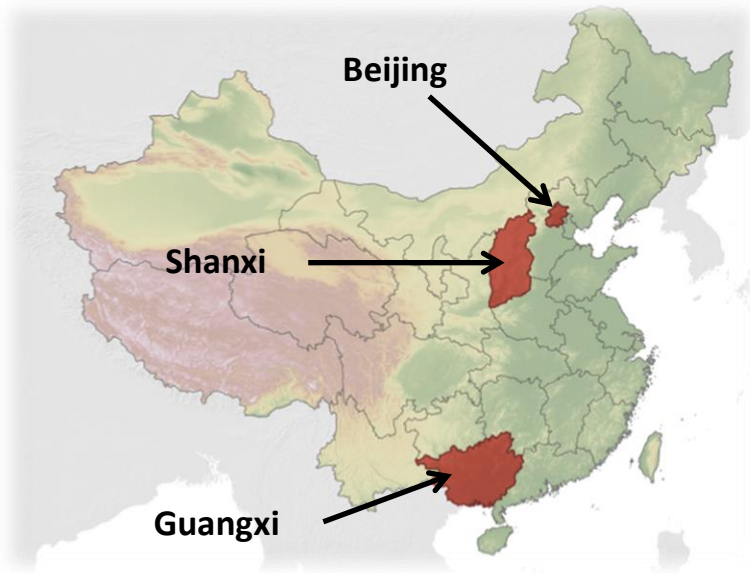

Biomarkers of
early effect

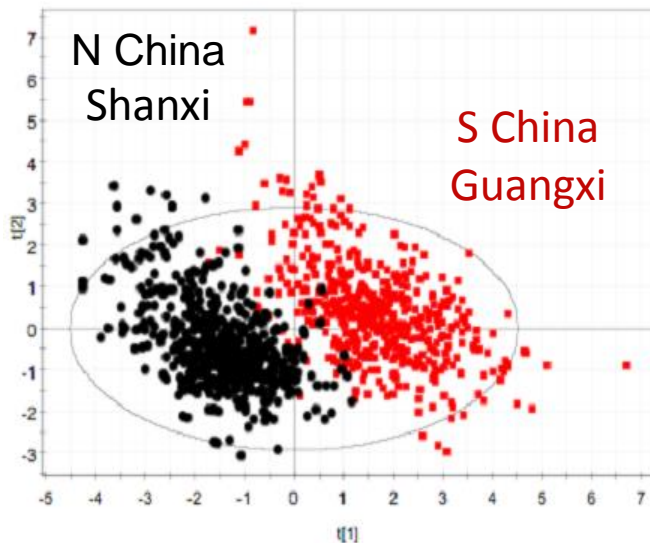

Clinical
measures

Study platform: INTERMAP China sites and participants

- 839 men and women, 40-59 years
- Multiple visits and measurements of diet, alcohol, weight, height, blood pressure, and socio-demographic variables
- Two 24-h urine collections

| Trait | Mean (SD) | |
|-----------------|-----------------|-----------------|
| | N China (N=523) | S China (N=244) |
| SBP mm Hg | 123.8 (18.6) | 115.4 (13.0) |
| Ur Na mmol/24h | 271.4 (88.3) | 139.2 (55.5) |
| Ur Na/K ratio | 7.8 (2.4) | 3.7 (1.5) |
| Ca mg/1000 kcal | 136.5 (48.4) | 175.0 (62.5) |
| Mg mg/1000 kcal | 133.2 (38.7) | 198.2 (27.2) |

Stove modification, testing, and adaptation to household use

Technology development

Laboratory emissions testing

Testing in the rural energy lab

Pilot at village demonstration sites

Summary

- Major chronic diseases (e.g., heart disease, metabolic disease) at epidemic proportions worldwide and largely **environmental in origin**
- MWAS via NMR, MS and other high-throughput **omics technologies** applied to **large-scale epidemiological studies** offer new opportunity for **discovery** on the **causes and mechanisms** of disease
- Dedicated high throughput facilities are required to carry out this work (like the MRC-NIHR National Phenome Centre at Imperial/King's College)
