# Air pollution is a major public health issue

- Mainly due to fine particles – the effects of PM<sub>2.5</sub> on premature mortality
- But there is increasing evidence of the independent effects of NO<sub>2</sub>

*The Mortality Effects of Long-Term Exposure to Particulate Air Pollution in the United Kingdom*

A report by the Committee on the Medical Effects of Air Pollutants

## Across the UK poor air quality.....

- equivalent of 29,000 premature deaths due to breathing tiny particles released into the air (in 2008 data)
- the average loss of life was 6 months, (although the actual amount varies between individuals, from a few days to many years)
- ‘...air pollution may have made some contribution to the earlier deaths of up to 200,000 people in 2008, with an average loss of life of about 2 years per death affected...’
- Economic cost of the order of £8-20 billion per year (from IGCB)

# UK Climate Change Act 2008

- The UK has set a target of **80% reduction in CO<sub>2</sub> equivalents by 2050** (on a 1990 base)
- Making the right choices to achieve the Climate Change Act target offers potentially the biggest air quality & public health improvements since the Clean Air Act of 1956
- BUT – the policies need to be **carefully chosen** to avoid unnecessary adverse public health impacts – e.g. minimise diesel, biomass, CHP use in urban centres

AQ benefit

Flue gas desulfurization  
Three-way catalysts – petrol  
Particulate filters – diesel

Energy efficiency  
Demand management  
Nuclear  
Wind, solar and tidal  
Nitrogen efficiency  
Hybrids, LZEVs  
CCS

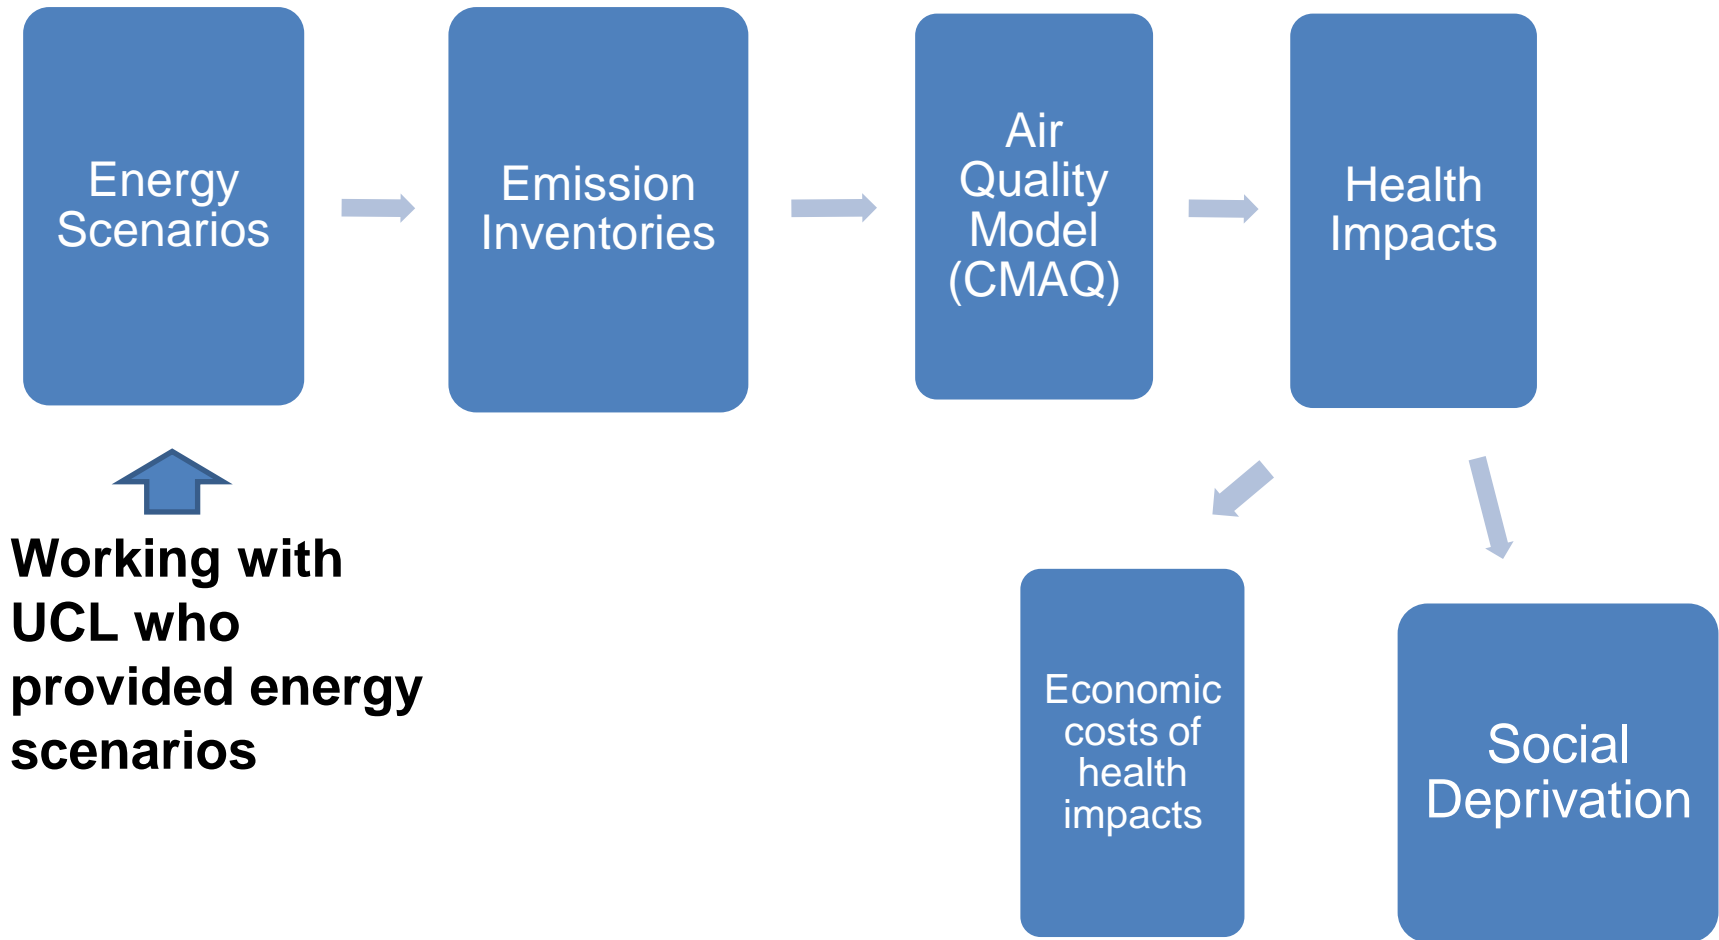

CC benefit

Uncontrolled coal and oil fossil  
fuels in stationary and mobile  
sources

Increase in 'uncontrolled' diesel  
Biofuels  
Biomass  
Combined heat and power?  
Buying credits overseas

## Linking UK Times outputs to UK and European Emissions

We have 'soft linked' the UK Times energy systems model (outputs provided by UCL, Mellissa Lott) which outputs energy use (PJ) - use this to 'scale' the 2011 NAEI 1km emissions to 2050.

Emission factor changes are made using NAEI assumptions up to 2030 and maintained between 2030 and 2050

For road transport we are currently running King's 'bottom up' emissions calculation between now and 2050 using detailed vehicle counts, speed and stock.

Centre for Environment & Health

# Scenarios

Scenario	Description	
DECC Baseline	DECC Baseline (no further carbon mitigation)	Nuclear phasing out
Reference	Same as Base + 30 GBP/tonne carbon price - increasing linearly from 0-30 GBP over the period of 2010-2030 (0-30 GBP) and then plateaued at 30 from 2030 onward; no constraints on nuclear	Nuclear expansion
Low GHG	80% reduction by 2050 + interim carbon budgets (through the 4th budget); no damage costs included for non-GHG air pollutants	In addition to 2010 and 2050, will look at an interim year (2030/5) to show the impact of the mid-term increase in residential biomass use for CHP
Nuclear – replacement only	LowGHG scenario + constraint on nuclear so that it can only maintain its current capacity levels.	Nuclear capacity capped at 10 GW (i.e. current levels)
Modal shift – active transport	In UKTM, this is the same as the lowGHG scenario, but we will replace enough car demand with active transport to maintain 2020 PM levels	To show benefits of a cultural shifts to reduce road transport/car use in London. EVs will not be enough.

# Health Impact Assessment method for long term exposure to PM<sub>2.5</sub> and NO<sub>2</sub>

## Full Impact methodology

- Uses life tables of pop. and death in 2010 by single year age group
- Follow life tables through for a lifetime 105 years to 2114, with new birth cohorts
- Use EPA lag 30% effect first year, 12.5% years 2-5, 20% years 5-20
- Results can be summarised as total Life Years and loss of Life Expectancy from birth
- Impact of future reduction scenarios on Life Years and life-expectancy

## Recent example of scenario testing in London for NO<sub>2</sub>

# Messages from the Low GHG (nuclear replacement only) scenario

- Urban levels of NO<sub>2</sub> and PM<sub>2.5</sub> should decrease significantly with corresponding improvements for public health
- **BUT** the incentivisation of biomass will lead to an increase in exposure to primary PM combustion products, including potentially to carcinogens peaking in 2030-2035
- Close to roads PM<sub>10</sub> may increase (non-exhaust pm)
- Long-term ozone exposure will increase – health effect evidence is needed
