

# **NO<sub>x</sub> and NO<sub>2</sub>** **in Paris region**

**London Air Quality Network Seminar**

**King's College – 1<sup>st</sup> July 2011**

**Christian RENAUDOT**  
**AIRPARIF, Paris, France**

# **NO<sub>2</sub> : one of the main air quality concern in Paris region**

---

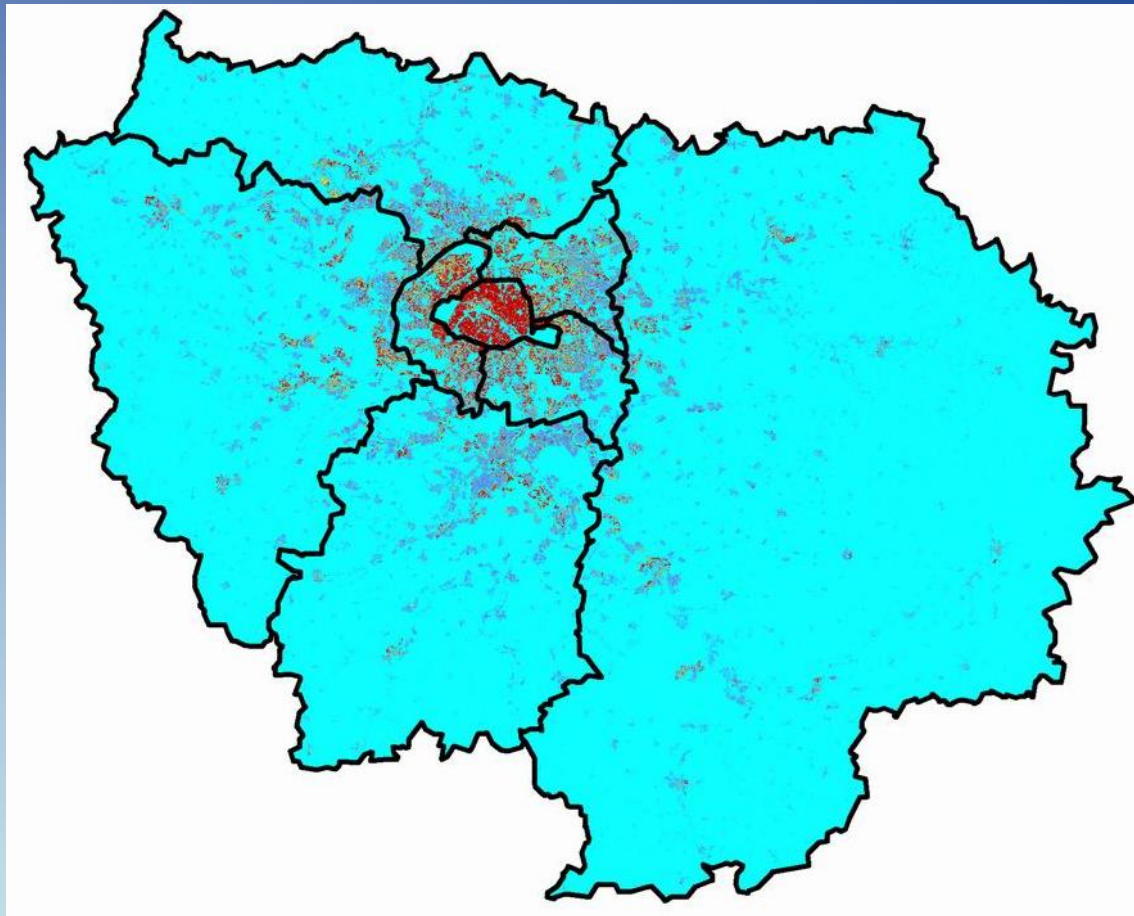

**Like most countries and main agglomerations in Europe, Paris region has 3 main air quality problems : PM10-PM2.5, O<sub>3</sub> and NO<sub>2</sub>.**

**Paris agglomeration is one of the 20 zones exceeding a limit value for PM10 in France and one of the few zones exceeding the annual limit value for NO<sub>2</sub>**

# Paris agglomeration distinctiveness

High population density in the centre of the agglomeration, particularly in Paris town : up to 20000 inhabitants/km<sup>2</sup>

Inhabitants/km<sup>2</sup>

# Paris agglomeration distinctiveness

Due to population density,  $\text{NO}_x$  emissions are important in the centre of agglomeration and along main roads

$\text{NO}_x$  tons/ $\text{km}^2$   
Year 2007

# Paris agglomeration distinctiveness

NO<sub>x</sub> emissions are mainly from road traffic (54 %) and residential/tertiary (24 %)

## 2 UE zones in Paris region

1- Paris agglomeration : 2853 km<sup>2</sup>, 10.3 millions inhabitants

2- Outside the agglomeration : rural & low density urban areas  
9160 km<sup>2</sup>, 1.3 million inhabitants

NO<sub>2</sub> problems are observed in the central  
portion of Paris agglomeration, both at background and  
near traffic situations

# NO<sub>x</sub>-NO<sub>2</sub> network

---

## 42 automatic monitoring sites : fixed measurements

- ▶ 32 background sites (30 urban, 2 rural),
- ▶ 10 road traffic sites

## 14 passive samplers sites : indicative measurements

- ▶ 14 weeks / year randomly determined
- ▶ 7 weeks during winter period, 7 weeks during summer period
- ▶ hot spots near road traffic
- ▶ annual means are estimated

Intensive campaigns with passive samplers : 2000, 2010  
centre of agglomeration, background and influenced sites

# NO<sub>x</sub>-NO<sub>2</sub> network

---

## Background sites

Criteria from French classification : distance required from road traffic depending on Annual Daily Traffic Average (ADTA)

ADTA vehicles/day	Minimal distance meters
< 1000	--
1000-3000	10
3000-6000	20
6000-15000	30
15000-40000	40
40000-70000	100
> 70000	200

# **NO<sub>x</sub>-NO<sub>2</sub> network**

---

## **Road traffic sites**

**Immediate vicinity of traffic**

**Sampling distance from road lane : from 1 to 2 meters**

**Sampling height : from 1.6 to 3 meters**

**Daily traffic : from 14.000 to 230.000 vehicles/day**

**Various types :**

**square, open avenue, canyon, canyon street, motorway...**

# NO<sub>x</sub>-NO<sub>2</sub> network

## Examples of monitoring sites near road traffic

# **NO<sub>x</sub>-NO<sub>2</sub> trends and concentrations in Paris**

---

**First automatic measures : 80's**

**But low quality data and only a few sites**

**Trends start during 90's, both for background and traffic**

## **Trends**

**3 years rolling mean to diminish the impact of meteorological variation from year to year**

**Same sample of sites for all the period pictured**

**Background : 6 sites**

**Traffic : 5 sites**

# NO<sub>x</sub> trends – background annual mean

After an important decline from the mid 90's to the mid 00's, levels are now constant

# NO<sub>x</sub> trends – road traffic annual mean

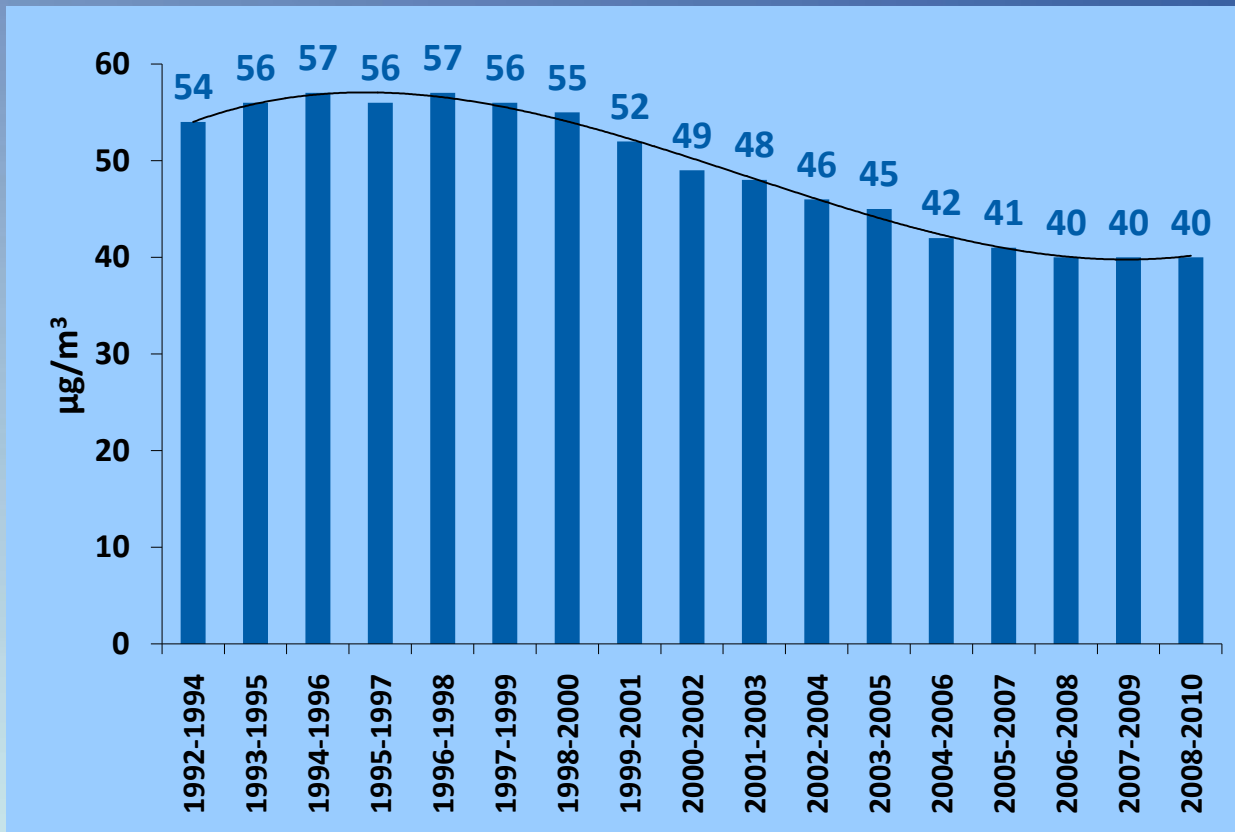

After an important decline from the mid 90's to the mid 00's, annual decrease is now less important

Benefit from catalyst converters is now less visible, most vehicles are now equipped

# NO<sub>2</sub> trends – background annual mean

After a significant decline from the mid 90's to the mid 00's, levels are now constant

# NO<sub>2</sub> trends – traffic annual mean

Mean level of NO<sub>2</sub> is steady on road traffic sites

- ▶ Sites with low traffic volume : slight decrease
- ▶ Sites with high traffic volume and/or high diesel vehicles proportion : increase since a few years

# **NO<sub>2</sub> trends – why the end of the decrease in background and increase on some traffic sites ?**

---

**Less benefit from catalyst converters, most of vehicles are now equipped.**

**Progressive arrival of diesel vehicles with particulate filter : less emissions of particulate matter but catalysed models have a negative impact on direct NO<sub>2</sub> emissions :**

**Due to oxidation at high temperature to eliminate particulate matter, there is an increase in NO<sub>2</sub> contribution among global NO<sub>x</sub> emissions**

**Some traffic sites with high volume diesel traffic (bus, trucks) observed increases in NO<sub>2</sub> levels**

# NO<sub>2</sub> trends – why the end of the decrease in background and increase on some traffic sites ?

Example of the Paris ring road, around 200.000 vehicles/day, no significant change in traffic volume/sort and road configuration

UE limit value  
since 2010

# NO<sub>2</sub> trends – why the end of the decrease in background and increase at some traffic sites ?

NO<sub>2</sub> /NO<sub>x</sub> emissions/concentrations

For each traffic site, calculation of ratio NO<sub>2</sub>/NO<sub>x</sub>

$[NO_2 \text{ traffic}] - [NO_2 \text{ background}] / [NO_x \text{ traffic}] - [NO_x \text{ background}]$

# NO<sub>2</sub> trends – maximum annual mean

# NO<sub>2</sub> trends – exceedances of 200 µg/m<sup>3</sup> threshold

One traffic site : increasing the number of hours exceeding the hourly European threshold

# NO<sub>2</sub> in Paris agglomeration – 2010 situation

---

Maximum annual mean

background : 44 µg/m<sup>3</sup>    traffic : 114 µg/m<sup>3</sup>

Maps for annual mean : background + traffic

- ▶ Background : geostatistical method, 30 sites co-kriging (NO<sub>x</sub> emissions)
- ▶ Traffic concentrations : modelled with STREET
- ▶ Between background and road immediate vicinity : linear decrease depending on urban configuration

# NO<sub>2</sub> in Paris agglomeration – 2010 situation

$\mu\text{g}/\text{m}^3$

— UE Limit value

40  $\mu\text{g}/\text{m}^3$

# 2010 situation – background NO<sub>2</sub> annual level

µg/m<sup>3</sup>

UE Limit value 40  
µg/m<sup>3</sup>

Area above the limit value  
(in orange colour) is  
slightly different

# NO<sub>2</sub> in Paris agglomeration – 2010 situation

Estimation of the inhabitants potentially exposed over the annual limit value (40 µg/m<sup>3</sup>) : from 3.5 to 4 millions each year

# NO<sub>2</sub> in Paris agglomeration – the future ?

---

In order to respect NO<sub>2</sub> limit value, plans are under construction

-LEZ in Paris : more polluting cars and trucks would be excluded from the centre of the agglomeration, 3 years experimental period

*Which type of vehicles ? still in discussion, AIRPARIF is working on emissions estimations in accordance with several hypothesis*

- Paris agglomeration = sensitive zone where air pollution will be considered as a priority against climate change and greenhouse gas : avoid measures on greenhouse gas that could have a negative impact on air pollution

# NO<sub>2</sub> in Paris agglomeration – the future ?

---

First objective is to avoid exceeding the annual limit value at background sites and to reduce the number of inhabitants exposed to it

First elements about NO<sub>2</sub> levels in 2020 calculated according to 2 road traffic hypothesis :

- 1 - no new actions : road traffic will still increase
- 2 - new measures to reduce road traffic and increase public transport

Limits : NO<sub>2</sub> primary emissions from diesel vehicles are very uncertain in the future

Only little differences on NO<sub>2</sub> levels between hypothesis, main reduction comes from technological progress (EURO standards)

# NO<sub>2</sub> in Paris agglomeration – the future ?

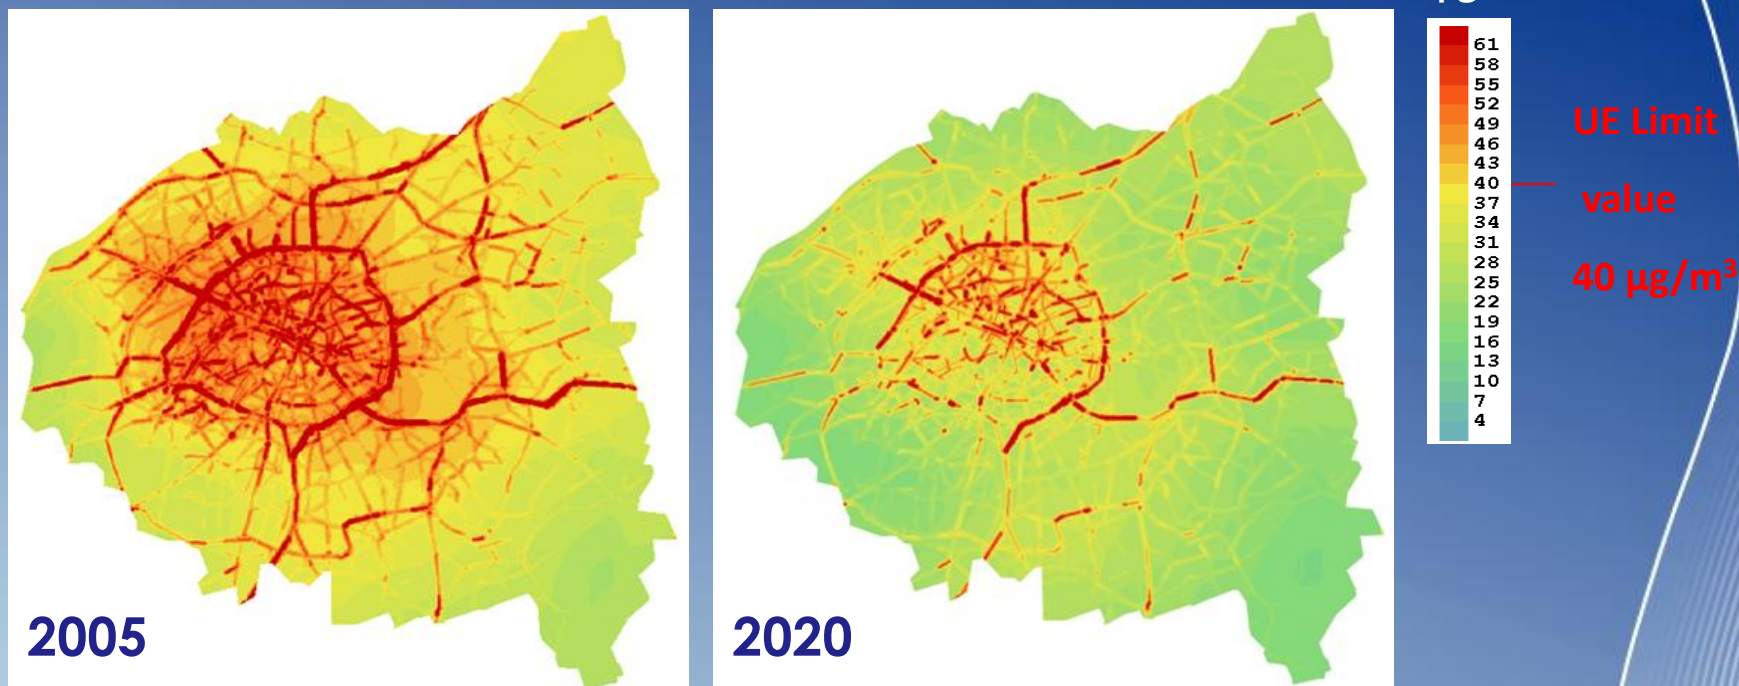

Road traffic emissions : reduction in % between 2005 and 2020

Hypothesis 2 : - 45 to -75 %

# NO<sub>2</sub> in Paris agglomeration – the future ?

## NO<sub>2</sub> annual level 2020 versus 2005, hypothesis 2

Important reduction but still insufficient near the traffic on main roads

Other reductions have to be found, road traffic and other sources : work in progress about residential/tertiary emissions

# NO<sub>x</sub> and NO<sub>2</sub> in Paris region

---

Thanks for your attention and ...  
hope my English was clear enough
